

2022 Non-Resident Fee
Mathematical formula method:

Divide library income from public property tax source by local population to get the cost per capita figure.
Multiply per capita figure by the average number of persons per household (found on census website) to obtain the average cost per household for family library card fee.

Library income from public property tax sources property tax income
\$1,811,816.85

Divided by total population 17,027

Equals cost per capita \$106.41

Multiplied by average number of persons per household 2.81

Equals average cost per household for a family library card \$299.00
This is the cost per family it does not matter if it one person or more.
